Examples from Multilevel Software Comparative Reviews

Douglas Bates
R Development Core Team
Douglas.Bates@R-project.org

August 31, 2004

Abstract

The Center for Multilevel Modelling at the Institute of Education, London maintains a web site of "Software reviews of multilevel modeling packages". The data sets discussed in the reviews are available at this web site. We have incorporated these data sets in the <code>lme4</code> package for R and, in this vignette, provide the results of fitting several models to these data sets.

1 Introduction

2 Two-level normal models

The Exam data set is used in fitting examples of two-level normal multilevel models.

```

There are some interesting aspects of data management that show up in the analysis of these data. The **student** variable is an identifier of the student within the **school**. It would be best to combine the indicators of school and student to get a unique identifier of the student.

```
$ intake : Factor w/ 3 levels "bottom 25%","mi..",..: 1 2 3 2 2 1 3 2 2 3 ...
$ standLRT: num  0.619  0.206 -1.365  0.206  0.371 ...
$ sex : Factor w/ 2 levels "F","M": 1 1 2 1 1 2 2 2 1 2 ...
$ type : Factor w/ 2 levels "Mxd","Sngl": 1 1 1 1 1 1 1 1 1 1 1 ...
$ student : Factor w/ 650 levels "1","2","3","4",..: 143 145 142 141 138 155 158 115 117 113 ...
$ ids : Factor w/ 4055 levels "1.143","1.145",..: 1 2 3 4 5 6 7 8 9 10 ...
```

Notice that there are 4059 observations but only 4055 unique levels of student within school. We can check the ones that are duplicated

```
> Exam$ids[which(duplicated(Exam$ids))]
[1] 43.86 50.39 52.2 52.21
4055 Levels: 1.143 1.145 1.142 1.141 1.138 1.155 1.158 1.115 1.117 ... 65.56
```

One of these duplicated cases is particularly interesting. One of the students with the duplicated student id 86 in school 43 is the only male student in this mixed school. This is probably a case of a misrecorded school.

3 Three-level Normal Models

```
Data from the 1997 A-level Chemistry exam are available as Chem97.
```

```
